Growing deer populations Serious conflicts about damages

What is consumed, what is browsed?

Which forest species are more preferred by wild ungulates (deer)?

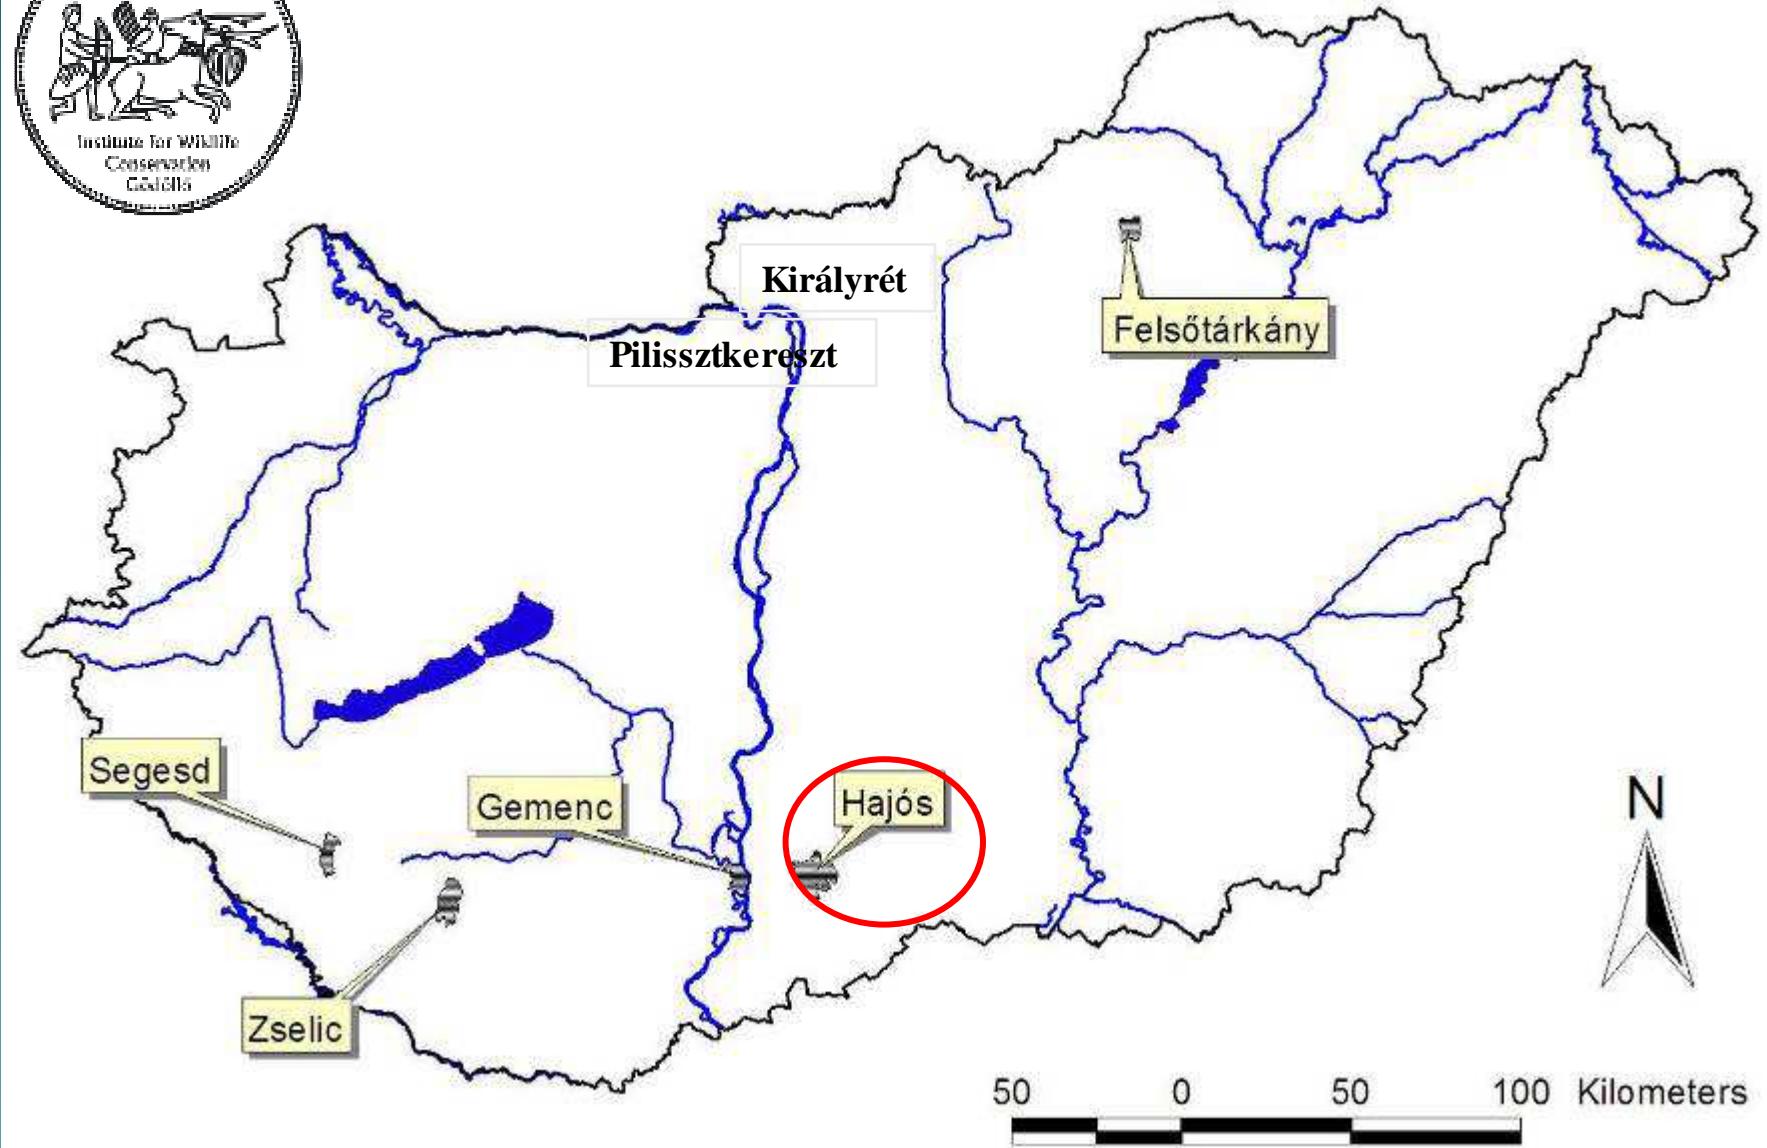

- native target tree species (oak)
- non-native target tree species (locust)
- economically non-relevant species

What are the main components of deer diet?

- native target tree species (oak)
- non-native target tree species (locust)
- economically non-relevant species
- supplementary feed

Proportion of supplementary food in the diet of deer individuals using the feeding plot in Hajósszentgyörgy

Katona, K., Szemethy, L., Gál-Bélteki, A., Terhes, A. and Bartucz, K. 2011. How important is supplementary feed in the winter diet of red deer? A test in Hungary . Wildlife Biology, submitted.

Message

- ◆ Pedunculate oak can lose against black locust
 - Drought, drying
- ◆ Close to nature forest management (selection cutting and not clear-cutting)
 - Diversity in the forest increases
- ◆ Multispecies understory
 - attractiveness of oak species is much less to browsing than that of black locust
- ◆ Pedunculate oak can win over black locust
 - selective browsing
- ◆ Counteracting impacts:
 - climate change, deer and HUMAN
